

How to enable the Sophos antivirus engine in GFI MailEssentials

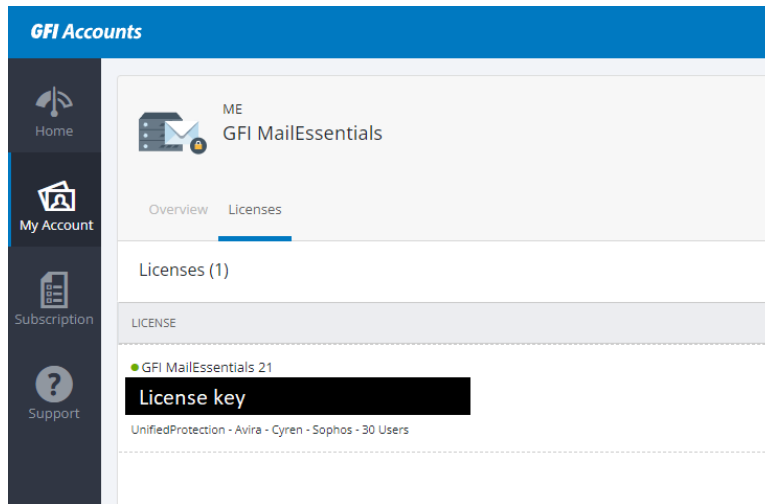

The new license information synchronizes with your application if your GFI MailEssentials deployment licenses with a GFI Accounts connection. Follow these steps to enable Sophos in a few minutes:

- Open GFI MailEssentials.
- Select EmailSecurity > Virus Scanning Engines > Sophos in the tree menu on the left.
- Under Options, select the Enable Gateway Scanning (SMTP) checkbox. You can choose to scan inbound emails, outbound emails, or both.
- Click Apply at the top to save the changes.

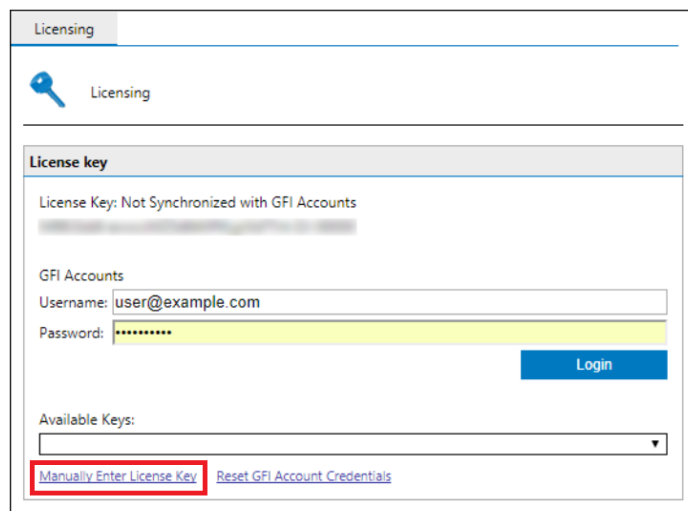

If you use a license key to activate GFI MailEssentials, you need to retrieve the new license key from the GFI Accounts Portal and manually enter it in GFI MailEssentials. After that, Sophos will become visible in the product, and you can enable it.

- a. Log in to the [GFI Accounts Portal](#).
- b. Navigate to My Account, and click on More Details under GFI MailEssentials.
- c. Select the Licenses tab, and copy the license key. (Sophos would be present under the license key.)

- d. Now open GFI MailEssentials, and navigate to General Settings > Licensing.
- e. Click on the Manually Enter License Key link, paste your new key, and apply the changes.

- f. Once your new license key is active, navigate to EmailSecurity > Virus Scanning Engines > Sophos.
- g. Under Options, select the Enable Gateway Scanning (SMTP) checkbox. You can choose to scan inbound emails, outbound emails, or both.
- h. Click Apply at the top to save the changes.

Please contact your trusted GFI partner if you have any further questions or need assistance with switching to Sophos.
